TikZ and F

Customization Classes and Styles

## T<sub>E</sub>X's development:

- Motivated by poor page proofs of "The Art of Computer Programming", vol. 2, 2<sup>nd</sup> edition
- Guy Steele, again! Lobbied (successfully) for Turing-completeness;
- Hyphenation algorithm by Frank Liang, "Word Hy-phen-a-tion by Com-put-er"
- TEX version 3 released in 1989;
  - minor updates every 4 years or so;
  - version number approaches  $\pi$ .
- TEX source code is effectively Public Domain.

# LATEX: a Document Preparation System

Customization Classes and Styles

## LATEX:

- frontend to TEX;
- · widely used in the academic community;
- separation of formatting and content;
- wide variety of add-ons.

## Strengths:

- decent-quality output;
- · reasonable future compatibility;
- good support for mathematics;
- text-based format.

TikZ and F

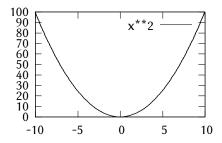

Classes and Style
Documented TeX

"The picture environment allows you to create just about any kind of picture you want containing text, lines, arrows and circles."

- use \put to put things in a picture;
- \line, \vector and \circle for lines, arrows and circles; Software capable of exporting to LATEX pictures:
  - Xfig
  - Gnuplot

## Generated from Gnuplot with

- set term latex size 2.5,1.5;
- plot x\*\*2 with lines.

Defects: poor font scaling; unconventional x\*\*2 label; unscalable; jaggies in the curve.

----

TIKZ and

Classes and Style
Documented TeX

Allow the inclusion of graphics in various formats:

- standard LATEX: Encapsulated PostScript;
- pdflaTeX and XaTeX: PDF, PNG.

Can apply scaling, image transformations and similar to the included image. For example:

\includegraphics[width=0.5\textwidth]{filename}

includes an image, scaling it so that its width is half the text width.

## C.S. Rhodes

Introduction

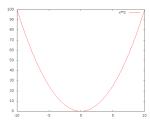

Grapnic

likZ and P

Classes and Styles

## Generated from Gnuplot with

- set term png;
- plot x\*\*2 with lines.

Defects: font shape mismatch; unconventional x\*\*2 label; only partly scalable.

Grapnic

Font

Classes and Styles
Documented TeX

The psfrag package allows the replacement of postscript strings in an included 'image' with LATEX-formatted fragments.

- \psfrag{x\*\*2}{\$x^2\$}
- \psfrag{100}{\small 100}
- Does not work with PDF output.

The pstricks package (and many add-on packages) allow the construction of all sorts of graphics, implemented through the emission of PostScript specials:

- \psplot x sqr [FIXME]
- Does not work with PDF output;
  - but see the pst-pdf package.

The tikzpicture environment surrounds the commands to construct a picture or diagram.

Shortcuts:

- ioricats
- \tikz[options]{commands}
- \tikz[options] text;

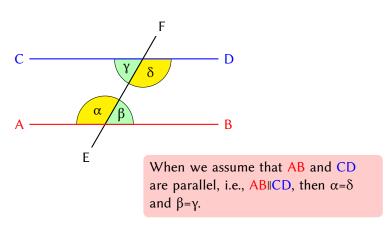

Within the tikzpicutre environment go commands to construct, stroke and fill paths, similar to many graphical systems in common use.

## OpenType fonts:

- outline descriptions of glyphs;
- wrap either PostScript or TrueType glyph data;
- include metadata regarding scripts;

Microsoft and Adobe collaboration, intended to supersede both Type 1 and TrueType fonts: ISO/IEC 14496-22

X<sub>7</sub>T<sub>F</sub>X and the fontspec package

Introductio

miroductic

TikZ and

I OIIL

Classes and Styles
Documented TeX

### X<sub>7</sub>T<sub>F</sub>X is a modified T<sub>F</sub>X engine:

- uses 'words' rather than characters as the basic building block
  - breaking words up if it is necessary to hyphenate
- allows transparent use of system-installed fonts
  - TrueType and OpenType by default;
  - Also allows PostScript fonts to be used if specified
- accepts UTF-8 input;
- outputs to PDF.

X<sub>7</sub>T<sub>F</sub>X and the fontspec package

#### Introductio

TikZ and

Classes and Styles
Documented TeX

#### The fontspec package:

- works with the X<sub>3</sub>T<sub>E</sub>X version of L<sup>A</sup>T<sub>E</sub>X;
- easy access to fonts;
- straightforward access to those fonts' features:
  - alternate forms;
  - rare ligatures and swashes;
  - variant numeral styles;
  - kerning, tracking and optical justification;

Introduction

Graphic

TIKZ dilu

Classes and Styles

A minimal style file contains two things:

- a declaration of the minimum LaTeX requirements it needs, using the \NeedsTeXFormat macro;
- a declaration of what the style file provides, using the \ProvidesPackage macro.

#### Example:

```
\NeedsTeXFormat{LaTeX2e}[1995/12/01]
\ProvidesPackage{foo}
  [2009/07/21 v0.1 Goldsmiths 'foo' package]
```

# Classes and Styles Less minimal style files

Introductio

Graphics

F--4-

Classes and Styles
Documented TeX

Normally, style files contain more functionality than that. They can

- load other style files, using \RequirePackage
- define LATEX macros, using \newcommand or \renewcommand
  - or the lower-level TEX defining macros \def or \edef
- define LaTeXenvironments, using \newenvironment or \renewenvironment
- declare pieces of code to be run when options are passed to the package, using \DeclareOption
  - and using \ProcessOptions to actually run the code.

## Classes and Styles Minimal Class file

Introductio

Graphic

TIKZ BIK

Classes and Styles
Documented TeX

A minimal class file contains the same information as a minimal style file:

- a \NeedsTeXFormat declaration;
- a \ProvidesClass declaration;

but must also provide four definitions:

- \textwidth, the width of the typeset text on the page;
- ② \textheight, the height of the typeset text on the page;
- ③ \normalsize, a declaration for the size of the normal font;
- a page numbering specification.

### Classes and Styles

Minimal Class file

Introduction

Classes and Style

Documented TeX

The Documented TEX conventions are a set of rules, and some tools, for writing and documenting TEX and LATEX software.

- The docstrip package reads docmented TeX and produces class files, style files, and any other ancillary files required to use the software
- The doc package reads documented TEX and produces documentation, which can include
  - · a user guide;
  - a change log;
  - · a listing of the software;
  - a cross-referenced index of all macros described, used or defined.

Aside: Literate Programming

Introduction

Grapnics

Font

Classes and Styles

Documented TeX

Literate Programming is a style of programming which encourages or forces the author of the code to explain the thought process behind it. Potential benefits:

- reveals design errors;
- easier to keep documentation up to date with code;
- gives reward feedback for writing documentation
  - increases likelihood of documentation being written in the first place;

As well as documented TEX, systems for literate programming include

- web, including cweb and noweb
- pbook.el

Customization
Classes and Style
Documented TeX

The structure of a documented TEX file is complicated:

- written in several 'languages' simultaneously;
- can produce multiple output files;
- · comments, meta-comments and directives.

I don't have a marvellous description, but even if I did this slide would be too short to contain it:

· work by example.
